# Agentic Development Training

Your handover — read this before you start.

This is a self-paced training program covering everything from your first deliberate use of an AI coding assistant through to shipping production agents with evals, observability, and rollback plans. You'll work through one short module per week, then have a 15-minute check-in with your engineer lead. About 90 minutes a week total. Spread it however suits you.

## Get started in 5 steps

- 1

**Clone the repo and open a terminal in it.**  
`git clone <repo-url> && cd agentic-dev-training`
- 2

**Install dependencies (one time).**  
`npm install`
- 3

**Launch the local app.**  
`npm run dev` — opens in your browser at `localhost:5173` .
- 4

**Take the placement quiz** (10 questions, ~5 minutes). The app sets up your cohort folder automatically with your name, score, and starting level.
- 5

**Open your first module** from the *My modules* page and follow the read / do / self-check flow. When you're done, reach out to your engineer lead for a 15-minute check-in.

**Don't want to use the app?** Open module files directly from `modules/` in your editor and read `placement-quiz.md` to find your starting level.

## The four levels

| LEVEL      | YOU ARE HERE IF...                                                | CAPSTONE                                                |
|------------|-------------------------------------------------------------------|---------------------------------------------------------|
| 1 · Novice | You've used AI tools casually. No daily, deliberate workflow yet. | Ship a real PR with Claude Code, plus a 600-word retro. |

| LEVEL                   | YOU ARE HERE IF...                                                 | CAPSTONE                                                                     |
|-------------------------|--------------------------------------------------------------------|------------------------------------------------------------------------------|
| <b>2 • Practitioner</b> | Confident daily user. Have called the API at least once.           | Build a small internal tool with tool use + a 10-case eval suite.            |
| <b>3 • Proficient</b>   | Have shipped an LLM feature. Hit at least one production surprise. | Ship a production agent with CI evals, observability, safety, rollback plan. |
| <b>4 • Expert</b>       | Architect, mentor, standard-setter.                                | None — sustaining role.                                                      |

## How a week looks

|                                                                                                                                                         |                                                                                                                                                                                           |                                                                                                                                                               |
|---------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>~75 MIN</b><br><b>Self-paced module</b><br>Read the linked docs (~15 min), do the hands-on exercise with starter code (~60 min), run the self-check. | <b>~15 MIN</b><br><b>Check-in with the lead</b><br>Reach out via Teams or however your team talks. Bring the artefacts the module lists. The lead probes 2–3 questions and signs you off. | <b>REAL WORK</b><br><b>Capstone</b><br>Each level's capstone is applied to a real piece of project work — not a side project. Demo it to the lead when ready. |
|---------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|

## What you need before day 1

- **Python 3.10+** on your machine.
- **An Anthropic API key** — set as the `ANTHROPIC_API_KEY` environment variable. Ask the engineer lead if you don't have one.
- **Git access** to the training repo (clone, push to your own cohort folder).
- **Claude Code installed** for the L1 modules (docs at `docs.claude.com`).

## Where to get help

|                                                                                                                         |                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|
| <b>ENGINEER LEAD</b><br>_____ — your primary point of contact. Check-ins, sign-offs, and "I'm stuck" questions go here. | <b>STANDING TECHNICAL ADVISOR</b><br>_____ — escalation for L3 architecture and safety questions.         |
| <b>TEAM CHAT</b><br>_____ — Teams channel for ad-hoc questions and sharing wins.                                        | <b>REFERENCE DOCS</b><br><code>pathway.md</code> in the repo — full level descriptions and exit criteria. |

**Stuck for more than 30 minutes on a module?** Don't burn the evening. Ping the engineer lead. That's exactly what they're there for.
